

1.) <http://www.slate.com/> Alright so as for this link. It is a online magazine portal that I found. Then I clicked on the below link which can be found under video same sight. You click any link under video category. And it reroutes you so an alternate site which I believe host the vids and you can upload there. Um so the second is the actual layout I liked.

2.) <http://www.slatev.com/>

I love the simplicity of this site the navigation is pretty straight forward and is way more attractive than you tube (but not that much lol).

So for these we would need either to set up a database maybe Php or something we could use ex. Joomla. Also for the second we would need to use Flash media server.

3.) <http://group101films.com/watch.php#>

Works with the below site fyi check tat one out.

h4.) <http://www.group101spots.com/>

Ok so the deal with this site is a lot of content as you can see but if we could find away to arrange the layout its pretty clean if you navigate through the pages and overlook the first one. That is the idea.

5.) <http://www.thespotspace.com/index-new.php>

Again is a spin off of numbers 3-4 and is a community much like myspace, friendster, etc., for video and industry professionals.

These types of sites all use the same types of programs and or technology to show their bodies of work. HTML, XML, Flash, Dreamweaver, Photoshop, and Illustrator, just to name a few.

5 sites I already had found we can use these as references since I don't think it was needed right?
